Filtering, whether intended or unintended, modifies the magnitude and phase of signal frequency components. Every analog or radio frequency (RF) circuit performs filtering on the signals passing through them. Therefore for RF or analog circuit designer, it is important to understand, how to design and construct filters.

Active filters are vital in modern electronics; every data acquisition systems need them for bandwidth-limiting signals before ADCs as anti-aliasing filters, or after DACs as anti-imaging filters. Instrumentation also relies on them for accurate signal measurements. Active filters are used for cutoff frequencies that range from sub -1 Hz to 10 MHz, where passive filter designs would require

i Would suggest you take some courses in analog circuit design. With only a few semesters left, that doesn't give you a lot of options. Analog is a pretty broad term, but if you're particularly interested in working in the music field (where I worked for a number of years) you WILL need to get some knowledge on DSP, filters, amplifiers, etc.
